COORG.

IMPERIAL SERIES—VOLUME XII.

THE REPORT AND TABLES.

INTRODUCTION.

THE physical features of the province are varied. The southern, western and north-western portions of the country are intersected by a network of hills and forests subject to heavy rainfall. The north-eastern and most of the eastern portions are very different and resemble the adjoining Mysore tracts. The drainage of the country is all to the east except on the Western Ghats where it flows west.

2. There has been no change in the area of the province, but there has been a readjustment in the boundaries of the four taluks of Nanjarajpatna, Mercara, Padinalknad and Yedenalknad.

3. Ever since 1891, the census operations of this province have been entrusted to the general supervision of the Census Superintendent of Madras. For the first time since 1891, the work of writing this report, which used to be done by the Madras Superintendent, was entrusted to a local officer, although the work of tabulating the statistics was done in one of the Madras abstraction offices. This course was actually recommended by Mr. Molony, the Madras Census Superintendent, in 1911. It is a matter for regret that statistics relating to the predominant caste in Coorg, viz., Coorgs, has had to be pronounced inaccurate owing to mixing up the figures relating to Kodagas, Amma Kodagas and Jama Kodagas referred to in detail in Chapter XI of the Census Report of 1911. An attempt was made to rectify the blunder by reference to the Census Superintendent, Madras, but without avail, as the enumeration schedules were reported to have been destroyed. Similar errors on a minor scale were noticed in regard to the Gauda community of whom more than 1,000 persons were for the first time found to have been classed as animists. The statistics for Brahmans have swelled to an unprecedented and inconceivable extent when compared with last census figures. In these circumstances the Census Superintendent, Madras, had to cancel Imperial Table XIV relating to civil condition by age for selected castes. Thus an opportunity to gauge the civil condition of the main castes in Coorg was lost. In this connexion it must be remarked that it would have been quite possible to set right this fatal defect, if the abstraction office had been located in the province. Of course, it was a question of funds and taking the small area of the country into consideration, it may not be desirable to set up a costly abstraction office in Coorg. But the fact remains that, with all the advantages of local knowledge, the officer entrusted with the task of preparing the report will be considerably handicapped if the figures on which he has to base his conclusions

turn out to be unreliable through the blunder of either enumerators and supervisors or the staff of the abstraction office. Now that the logical step of getting the census report written by a local officer has been taken, it seems essential that the question of ensuring the accuracy of the statistics at least for the future should be tackled. It is therefore suggested that an estimate should be made of the funds necessary for setting up a separate abstraction office in Coorg. In the event of its being found to be of a prohibitive nature, it seems worth while to consider the question of deputing a few intelligent clerks to help the abstraction office set up elsewhere in regard to the tabulation work concerning Coorg.

4. As for the census operations in Coorg, the method adopted was the same as in 1911 and worked satisfactorily. The country was divided into seven charges, two of them being the two municipalities in charge of the President, Mercara Municipality, and the Munsif of Virarajendrapet, and the remaining five in charge of the five Subedars. The total number of circles was 127 which were further divided into 1,431 blocks.

5. The house numbering was commenced in June 1920 and ended about the 15th July. The preliminary census was conducted on 1st February 1921 in rural areas and on 15th February in the towns. The final census was taken on the night of the 18th March. On the 19th morning, the supervisors assembled at the headquarters of each taluk and prepared the taluk totals for transmission to the district office at Mercara. The district office worked up the taluk totals and telegraphed them to the Census Commissioner with the Government of India and to the Madras Census Superintendent on 22nd March 1921. The difference between the preliminary figures and the final figures shows that the former was in excess of the actual figure only by 621. The Forest Department conducted the preliminary as well as the final census of the jungle tribes on the 1st March and the 18th March 1921, respectively, without experiencing any difficulty. The industrial census was taken on the 10th March.

6. Coorg was singularly free from the non-co-operation agitation and the people at large rendered all the help they could in facilitating the work of the census staff. One solitary instance of obstruction was reported from Mercara taluk where the enumerator was refused facilities to approach a house by an estate writer. He was also alleged to have refused to answer questions put to him. The man was dealt with in the criminal court under sections 7 and 8 of the Census Act and fined Rs. 10. This action on the part of the accused was said to have been due to private malice.

7. Mr. Hilton Brown, I.C.S., First Assistant Commissioner of Coorg, was throughout in charge of the census operations in Coorg.

CHAPTER I.—DISTRIBUTION AND MOVEMENT OF THE POPULATION.

THE area of the province is 1,582 square miles. The boundary of the province did not undergo any change during the decade but the areas of four taluks were readjusted in 1916 when certain revenue circles were abolished for administrative reasons. The variations in the areas and population of taluks are given below :—

Changes in area

Taluk.	At census of 1911.				After readjustment of boundaries in 1916			
	Area in square miles.	Population.			Area in square miles	Population based on census of 1911.		
		Total.	Males.	Females.		Total.	Males.	Females.
1	2	3	4	5	6	7	8	9
Total ..	1,582	174,976	97,279	77,697	1,582	174,976	97,279	77,697
Kiggatnad	421	39,767	21,711	18,056	421	39,767	21,711	18,056
Mercara	227	26,604	15,727	10,877	310	28,795	17,336	11,459
Nanjarajpatna	317	40,513	21,672	18,841	235	34,333	17,936	16,397
Padinalknad	399	26,827	14,039	12,828	395	30,325	15,850	14,475
Yedenalknad	218	41,225	24,130	17,095	221	41,756	24,446	17,310

Another change inaugurated in the course of the decade was the clubbing of the many small villages in 1916, resulting in the reduction of the number of villages from 493 to 377.

2. The term “ population ” as used in this report exclusively refers to persons enumerated on the 18th March 1921. There is no question of *de jure* population for Coorg. The population as returned at the 1921 census is 163,838—a decrease of 11,138 from the figure for 1911. The talukwar area and population are given in Provincial Table I. The variation in population as compared with 1911 shows that Yedenalknad taluk has sustained the greatest loss. Nanjarajpatna taluk comes next. This decrease has not, even in the main, any bearing on the resident population. This will be apparent from a comparison of the figures shown in Subsidiary Tables 1 (a) and (b) attached to Chapter III which makes it clear that the decrease in the population of the province is almost wholly due to the decrease in the number of persons born outside but enumerated in Coorg. So far as local conditions go, the contraction in the area under coffee to the extent of 2,363 acres in the course of the decade greatly diminished the need for immigrant labour. Increased demand for labour created within the planting districts of the Mysore State and the Madras Presidency in the later years of the decade has also contributed towards restriction in the supply of labour to Coorg. On the whole, there is no reason to doubt the accuracy of the enumeration.

Definition of population and summary of statistics

3. The density of the population in 1921 is 104 per square mile against 111 in 1911. If the 600 square miles of forests are excluded, the density comes to about 167. Subsidiary Table 1 gives the mean density in cultivated area and also details regarding cultivated area, water-supply and crops. Subsidiary Table 2 shows area and population of taluks classified according to density. The variation in population in Coorg, as a rule, has very little to do with the natural population. It almost invariably hinges upon the fluctuations of the coffee industry which is mainly dependent upon immigrant labour. This fact is well illustrated in the figures given in Imperial Table II. It does not, however, follow

Density and variation

from this that resident population is stationary. This matter has been dealt with at length in paragraph 6 below.

**Condition
of the
decade**

4. The country is mainly agricultural in its nature. The only industry worth mentioning is coffee. There are also a few rubber plantations, a tea garden and an agave plantation. Coffee is now worked only by Europeans and a handful of well-to-do Indian planters. The elimination of the small planters without much capital which commenced as far back as 1901 continued to the present decade. Owing to the outbreak of war and consequent rise in the wages of coolies on account of the rise in cost of living, even the best equipped planters found it hard to tide over their difficulties in 1918 and applied for and got State help. At the time of taking the census, there was no sign of decrease in the large cost of management.

5. As regards the main section of the population engaged in agricultural pursuits, those who were ruined by speculation in coffee energetically took to rice cultivation, increasing the area under rice by 2,368 acres. The rise in the prices of necessities since the outbreak of war caused them a certain amount of distress. But the splendid prices which paddy fetched in Malabar and Mysore markets enabled them to make both ends meet. At the same time the recruitment of about 800 men for the Coorg Regiment from among the poor middle class people brought in a great deal of monetary relief to their families. Another noteworthy feature is that at no time was there any fear of famine intruding its unwelcome presence into the country. The rainfall was ample, although erratic in some years, and there was, throughout the whole decade, a considerable amount of surplus grain available for export to the adjoining districts.

**Public
health**

6. The foregoing remarks point to a certain amount of agricultural prosperity, but the same could not be said of public health. As elsewhere in India, influenza appeared in Coorg in a virulent form in 1918. Its effects in the succeeding years were such that within three years commencing from 1918, according to official figures, some 13,000 people became a prey to "fever," under which head deaths from influenza were returned. There is no doubt that the distress which people had to undergo in one form or other since the outbreak of the war, coupled with the influenza outbreak at the end of the decade, greatly affected the birth-rate, with the result that we find the incidence of births and deaths during the decade almost leaving the natural population in a stationary condition. There is some reason to believe that but for the havoc wrought by influenza, there would have been an appreciable increase in the natural population of the country. As it is, the natural population enumerated in Coorg shows an increase of only 460 over last census figures.

**Vital
statistics**

7. The vital statistics are recorded in nad offices in rural areas and by the two municipalities in urban areas. According to the figures given in Subsidiary Table 3, the number of deaths exceeds the number of births by 13,888. Owing to the presence of a large number of immigrant population, it is impossible to gauge the exact incidence of births and deaths exclusively relating to the indigenous population. The fact remains that the natural population born and enumerated in the country is only 460 in excess of the 1911 population. It may be mentioned here that the minus figure of 573 given in Subsidiary Table 3 is arrived at by taking into consideration the natural population enumerated both in and outside Coorg. The excess in the number of deaths cannot by any means be wholly attributed to the floating population although they must have suffered heavily from the rigours of the climatic conditions. The only plausible explanation of this anomaly seems to consist in the omission to record a great number of births, which is quite possible in the case of large numbers of Yeravas and others residing in forests as also in remote villages owing to the non-realization of the importance of vital statistics by patels, the majority of whom, in Coorg at any rate, are extremely ill-equipped for the purpose. No artificial methods are resorted to for keeping down the population. On the other hand, the mentality of the people at large is to have as many children as possible in entire disregard of the economic aspect of the question.

8. The movement of the population is all in the direction of absorbing as many immigrants as possible of the labouring classes, as the coffee industry and even the agricultural prosperity of the country is bound up with the labour that can be made available. The natural population is averse from migration except to a limited extent for purposes of education. It seldom seeks service elsewhere. It is interesting to note that whereas 3,853 persons born in Coorg were enumerated outside in 1911, only 2,825 were found to have been so enumerated in the present census. The immigrant population mainly consists of people from South Kanara, Mysore and Malabar, the majority of whom are labourers. Owing to the increased demand for their services in their own districts and elsewhere in Mysore and Madras, it seems to be a matter of doubt whether even the present supply can be counted upon in the decade to come.

**Movement
of the popu-
lation**

9. Imperial Table I gives the number of occupied houses in the province and the Provincial Table I similar details for each taluk.

**Occupied
houses**

A "house" was defined to mean "a dwelling place of one or more families with their resident servants, having a separate principal entrance from the common way." This interpretation has been in vogue for some decades in Coorg and the enumerators had no difficulty in following the instructions. The number of occupied houses has gone down by 2,348 since 1911, the decrease in the urban area being 432. The decrease is mainly due to the reduction in the number of the immigrant population. Subsidiary Table 4 shows the house room, density and variation in population since 1881. The average number of houses per square mile is 20 as compared with 21 in 1911, but there is no change in the average number (5) of inmates of each house. The joint family system which was in vogue among the indigenous population only three or four decades ago has practically disappeared giving room for individualistic expansion. This can by no means be considered as an unmixed blessing. As a rule only a few members of the family prove to be energetic enough to carve out their destinies by self-exertion; the rest find it difficult to make both ends meet as, although family property is legally indivisible and inalienable owing to the peculiar land tenures such as *jama*, *umbli*, etc., prevailing in the country, each individual member of the family is entitled to get what is termed a maintenance share of the property, which will necessarily be small in the majority of cases. The *jama* tenure implies payment of half the normal assessment leviable on land, the other moiety being remitted on account of the liability of holders to be called upon for military service to the State.

10. The pressure of population on the means of subsistence available is not such as to cause any anxiety. The staple food of the country is rice. The outturn is considerably more than is necessary for local consumption and a large portion is exported at considerable profit. The standard of living is comparatively high among the Coorgs who are predominant in every walk of life in the country. The well-to-do among them are well educated and to some extent follow European methods of living. The rest of the population, notably, Gaudas, are also following suit in the matter of a higher standard of comfort. The labourers, owing to a considerable increase in their wages, have also advanced their standard of living. The need for the introduction of intensive methods of cultivation is felt and steps are being taken to organize an Agricultural department on approved lines.

**Pressure of
population**

CHAPTER II.—POPULATION OF CITIES, TOWNS AND VILLAGES.

IMPERIAL Table I gives particulars of urban and rural population. Imperial Table III shows towns and villages classified by population. Imperial Table IV gives the list of towns classified by population with the variations since 1871, and Imperial Table V shows the town population classified by religion. At the end of this chapter there are three Subsidiary Tables (1) showing the distribution of the population between towns and villages, (2) the number per *mille* of town population by main religions and (3) the towns classified by population.

Reference
to statistics

2. There are only two towns and 377 villages. Mercara with a population of 5,675 against 6,269 of 1911 is the only town in the province which answers the definition of the town, viz., "a place inhabited by not less than 5,000 persons." The other town, Virarajendrapet, which has a population of 3,166 against 3,712 of 1911 has been specially classed as a town on account of its being a centre of trade and also a municipality. The population in both the municipalities has been gradually going down since 1881 and the remark made in paragraph 5, Chapter I, of the 1911 Census report to the effect that Mercara had added considerably to its population is opposed to facts. The decrease in the population seems to be mainly due to the decrease in the number of petty traders and their followers and has been brought about by the gradual reduction in the volume of trade as a result of the slump in the coffee trade. The percentage of reduction in the total urban population during the four decades ending 1921 is shown to be 31·8 (Subsidiary Table 3). Subsidiary Table 2 shows a substantial decrease among the Jain and Musalman population as worked out per *mille*, the figures being 203 and 177 against 670 and 206. The Parsis are altogether eliminated from this year's census, as the only family in Coorg is reported to have been absent from Coorg on the day of final enumeration. The great difference among Jains is not of much importance as actual figures show that there were only 65 Jains in 1911 and 41 in 1921.

Population
of towns

3. The sex proportion among the urban population indicates a great preponderance of males over females. This is due to the fact many traders from outside mainly among Musalmans such as Bhatkallis, Māppillas, etc., are not in the habit of bringing their womenkind to Coorg. This is evident from the fact that while the provincial average of females per 1,000 males is 831, that for Mercara stands at 713 and for Virarajendrapet at 610.

4. The village statistics show that there has been a reduction of 116 villages as compared with the number of villages at the time of taking census in 1911, viz., 493. This is due to the clubbing of smaller units for administrative purposes. The term "village" is merely a revenue expression of the administrative unit. Except the villages of Nanjarajpatna taluk, those in other parts of Coorg consist of isolated homesteads close to the wet and forest land owned by each family. Those of Nanjarajpatna taluk represent a cluster of houses like those of Mysore. The only striking difference to be observed in Imperial Table III is the elimination of three villages from the class having a population between 2,000 to 5,000. Two of these are Hosuru and Uluguli. These are plantation villages giving shelter to a large number of labour population and must have suffered in the general decrease of labour throughout Coorg. The other one is Chowdlu village. Here the difference is only apparent and was brought about by the splitting of the population between Chowdlu village proper and Somwarpet Notified Area which had been combined during the last census (See Village Statement for Nanjarajpatna taluk).

Village
population

5. Subsidiary Table 1 places the average population per village at 411, while it was only 335 in 1911. This of course is due to the combining of a number of smaller units as noted above. As regards the density of the village population, it is generally the case that most of the Nanjarajpatna taluk villages bordering on reserve forests and a few South Coorg villages bordering on hilly portions of the country are sparsely populated whereas villages situated in the plains and around trading, taluk and nad centres with road communications are generally more densely populated.

**Distribution of
population
between
towns and
villages**

6. The distribution of population between towns and villages is 54 and 946 per mille against 57 and 943 in 1911. There has been no great tendency to migrate into towns except by a few for Government service or for business, because there are no industries worth the name to attract the people from rural areas in large numbers.

CHAPTER III.—BIRTH-PLACE.

Reference to statistics

THE statistics relating to the birth-place of the population are to be found in Imperial Table XI. The Subsidiary Table 1 in two parts given at the end of the chapter shows variations in the natural and actual population between 1921 and 1911.

Emigration and immigration

2. The main indigenous population of the country comprising Coorgs, Yeravas, Kurubas, Holeyas, etc., have got no social and marital relationship with any class of people beyond the province. Consequently no migration is possible on an appreciable scale. The few among the higher classes who migrate do so with a view to secure higher education in the colleges of Madras and Mysore. Very few people are in employment elsewhere. A comparison of the figures for 1921 and 1911 (2,825 and 3,858) relating to the number of persons born in Coorg and enumerated elsewhere bears testimony to this fact. In view of these facts, practically no materials are available to discuss the question of migration from the various standpoints mentioned by the Census Commissioner in his notes bearing on this chapter. It is also worthy of note here that as a rule families among the main castes in Coorg do not even migrate from one part of the country to another even for the betterment of their own material conditions. The inalienable character of their holdings which were more than sufficient for their simple needs under the joint family system, seems to have developed a strong home-loving instinct. The people have not been able so far to outgrow this habit in spite of the practical disappearance of the joint family system and the rise in the standard of living. As regards immigrants, however, it may be remarked that the majority belong to the labour classes and only a few to the trading classes. The labourers can be classed as periodical immigrants and the latter, Bhatkallis, Mappillas and others, as semi-permanent immigrants.

Summary of statistics

3. The total number of immigrants enumerated in Coorg is 33,937 of whom South Kanara accounts for 11,724, Malabar 9,391 and Mysore State 10,544. The remaining 2,268 are from non-contiguous territories. A perusal of Subsidiary Table 1 (a) and (b) makes it clear that there has been a fall of 11,598 among those born outside but enumerated in Coorg. This decrease is mainly due to the reduction in the number of labourers who used to visit the country as a result of the gradual contraction in the coffee area ever since 1911-1912. There is also reason to believe that developments nearer the homes of the labourers induced an appreciable number of persons to stay away from Coorg which needs more than the available supply of labour.

4. There has been a slight decrease among persons claiming European countries as their birth-place, the figure for 1921 being 83 against 95 of 1911. This deficit does not signify much as the main deficit was brought about by the elimination of seven persons claiming Germany and Switzerland as their birth place in the previous census. The marginal figures exhibit the variation in European population since 1891.

Year	1921.	1911.	1901.	1891.
Population	83	95	113	125

5. A comparison of the figures representing immigrants and emigrants shows a net gain of 31,112 persons to the province against 41,677 in 1911.

CHAPTER IV.—RELIGION.

Reference to statistics

IMPERIAL Table VI deals with the general distribution of the population by religion and Provincial Table II with distribution of the population and their religion by taluks. The three subsidiary tables give information relating to (1) general distribution of population by religion, (2) the number and variation in the Christian population since 1881 and (3) religions of urban and rural population.

Variation by religion

2. The enumerators were instructed to enter the religion mentioned by the people without question and no particular instructions were given as regards the significance of the term beyond its ordinary meaning. Subsidiary Table 1 compares the general distribution of the population by religion since 1881 in proportions of 10,000. Except Animistic and Jain in whose case the gain is respectively 7·8 and 108·2 per cent over the 1911 figures, all other communities record a decrease over last census figures. The increase among Animists seems to have been due to the wrong enumeration of 1,162 Gaudas and 60 Holeyas who are Hindus, as Animists. It is however satisfactory to note that the anomaly noticed in the last census report of a number of Yeravas having been shown as Hindus has been substantially avoided this time. The increase among the Jains is obviously due to the accuracy of the enumeration made this time.

Hinduism

3. Hinduism is commonly understood in the sense of the definition given in previous census reports. There is therefore no necessity to make further comment on the matter except to state that any form of religious practice not foreign to the Hindu system is generally considered to be included in the term Hinduism. The Hindu religion shows, as usual, the largest following (126,697 against 138,922 of 1911), the decrease recorded in this census being obviously attributable to the decrease in the immigrant population who are almost wholly Hindus.

Muhammadanism

4. There is a slight decrease noticeable among Musalmans, the figures being 13,021 against 13,143 of 1911. This needs no comment.

Christianity

5. The Christian population has again suffered a diminution in numbers, the actual decrease as compared with 1911 being 371. If the figure for 1881 is taken into consideration, the net increase is only 1 per cent. Imperial Table XV gives the distribution of the Christian population by sect and race. The total Indian Christian population is 2,979 against 3,208 in the previous census, of whom 2,726 are returned as Roman Catholics, 45 as Lutheran and 191 as Methodists respectively against 2,830, 347 and 10 in the previous decade. While there is an abnormal decrease among Lutherans in 1921, the gain among Methodists is equally striking. The loss among Lutherans indicates the cessation of the activities of the Basel Mission Church since the outbreak of the war. The figures for Christians on the whole do not indicate any progress in proselytising.

Urban and rural population

6. Subsidiary Table 3 gives distribution of urban and rural population by religion in proportions of 10,000. A comparison with similar figures for 1911 shows that while Hindus have gained somewhat in the urban area, they have lost in the rural area; on the other hand Musalmans have lost in the urban area but gained in the rural area. Christians have lost both in urban and rural areas.

CHAPTER V.—AGE.

Reference to statistics

IMPERIAL Table VII gives details regarding the age distribution of the population and the nine subsidiary tables appended to this chapter show the important features thereof.

Value of the statistics

2. At the outset it may be mentioned that Coorg is no exception to the vagaries of the populace at large in the matter of either understating or overstating the age as it suits the youth or the aged. The ages given by the majority of the people are at best guess work. Another feature worth mentioning is the presence of a considerable number of able-bodied labour population in the prime of life which naturally permits of no accurate inferences being drawn as regards the resident population. Broadly speaking the figures for the 15-40 age period are affected by these immigrants. The overwhelming majority of these being males, the female population may be said not to be affected in a similar degree.

Age distribution

3. The statistics under "all religions" given in Imperial Table VII show that the total for the 0-5 period is the greatest as it should be. Then follows a downward course more or less on a graduated scale until we reach the 20-25 period. Thereafter a marked rise in the male population is to be observed. Next the 40-45 period shows a fall. Only 70 and over is better by 122 than the 1911 census figures. The figures for females are generally in excess of males up to the 4th year period in all censuses. This ascendancy is again observable in periods of life beyond 60.

4. A perusal of Subsidiary Table 3 shows that the proportion of children under 10 to 100 persons aged 15-40 has increased by 6.6 over last census figures and that the increase in comparison with 100 married females has been 15.4. The proportion of persons over 50 per 100 persons aged 15-40 has gone up by 12.2 among males and 13.3 among females and that of married women per 100 females of all ages has gone down by 1.1. The following statement is designed to show the fortunes of persons placed in the various groups from the census of 1901 onwards :—

Year.	0-5.		10-15.		20-25.		30-35.	
	Males.	Females	Males.	Females.	Males.	Females.	Males.	Females
1921 ...	10,151	10,537	9,521	8,610	8,956	7,587	8,706	6,023
1911 ...	9,775	9,985	10,226	9,022	11,034	8,635	9,358	6,309
1901 ...	9,571	9,894	11,855	10,385	10,153	8,311	10,739	6,742

Persons placed in the 0-5 group in 1901 have, when placed in group 10-15 of 1911, gained 655 males and lost 872 females. The gain in males seems to be due to the influx of immigrants and petty traders of the 10-15 age period. Similar comparison between 1911 and 1921 shows a loss of 254 males and 1,375 females. Again when persons in the 10-15 group of 1901 are placed in the 20-25 group of 1911 the decrease in males is 851 and in females 1,750. A similar comparison between 1911 and 1921 shows a loss of 1,270 males and 1,435 females. Persons in the 20-25 group of 1901, when placed in the 30-35 group of 1911, show a decrease of 795 males and 2,002 females. A similar comparison between 1911 and 1921 shows a decrease of 2,328 males and 2,612 females. It will be seen that the mortality among males and females in the prime of life in 1921 has been very great. Subsidiary Table 4 records a decrease of 11.1 per cent under the 15-40 age which is the highest on record since 1891.

Births and deaths

5. Subsidiary Tables 5 and 6 give details of the birth and death rates per mille during the decade. The year 1917 records the highest birth rate and the

lowest death rate during the decade. The period covered by 1918—1920 is considered to be the influenza period for Coorg and this belief is amply justified by the birth and death rates during that period. The year 1920 shows the lowest birth rate and the highest death rate. Subsidiary Table 7 shows the death rate among the females to be predominant in the reproductive age (15-40). The infant mortality for the period "under 1 year" although great, shows improvement over the 1911 figures. Subsidiary Table 8 records an abnormal number of deaths due to "fever" in 1920.

c. The mean age stands at 25 for males and 24 for females which were the same for 1911 and shows that on the whole there is no cause for anxiety as regards the fecundity of the population in spite of the havoc wrought by influenza. It is a misfortune that this could not be illustrated by reference to age distribution among the main castes in Coorg owing to the hopeless inaccuracy of the figures given in Imperial Table XIV as has already been observed in the introductory chapter.

7. Subsidiary Table 2 gives age distribution of 10,000 of each sex among Hindus, Muhammadans and Christians during the four censuses (1881—1921). Hindus under the age periods 0-5 and 5-10 show substantial progress over the 1911 figures. The same is the case with Christians. Muhammadans show an increase under the 0-5 period and a decrease under the 5-10 period.

CHAPTER VI.—SEX.

**Reference
to statis-
tics**

IMPERIAL Table I deals with the distribution of population by sex and Provincial Table I by taluks. Subsidiary Table I gives information relating to the number of females for 1,000 males at different age periods by religions at each of the last four censuses. Subsidiary Table 2 exhibits the actual number of births and deaths reported since 1891 and table 3 the number of deaths of each sex at different age periods.

**Sex propor-
tion**

2. Out of 163,838 persons enumerated in Coorg, 89,501 were males and 74,337 females, the excess of the former over the latter being 15,164. This gives a proportion of 831 females to 1,000 males. The proportion was 799 in 1911. The disparity between the two censuses is mainly to be accounted for by the drop in the number of immigrants in 1921. Eliminating the immigrant population as classified in Subsidiary Table 1 (*a* and *b*) attached to Chapter III, we find that the sex proportion of the people born in Coorg gives a ratio of 960 females to 1,000 males, which is the same as the all-India average. Coorg is no exception to the general rule of high mortality among males in the infant stage although generally speaking the evils of early marriage do not affect the indigenous Coorg population who celebrate post-puberty marriages. The preponderance of females over males continues up to the 10 age, the figures for Hindus, Musalmans and Christians, respectively, per 1,000 males being 1,037, 991 and 1,000. At the 0-30 period the proportion stands at 923, 608 and 942, respectively, and at "30 and over" 749, 485 and 690 (Subsidiary Table 1).

3. The sex proportion in Mercara and Virarajendrapet stands at 713 and 610 per 1,000 males. This great disparity is due to the trading classes such as Bhatkallis and Mappillas who leave their women kind in their native places.

4. An analysis of the talukwar figures shows that Mercara and Yedenalknad have the lowest proportion of females, the figures being 711 and 745 per 1,000 males. This is apparently due to the fact that the greatest number of the floating population is engaged in these two taluks where the coffee area is the largest. They are also the greatest trade centres.

**Comparison
with vital
statistics**

5. A comparison of the vital statistics (Subsidiary Table 2) shows the number of female births per 1,000 male births in 1911—1920 to be 951 and number of female deaths per 1,000 male deaths to be 867 against 986 and 813 in 1901—1910. Subsidiary Table 3 gives the death of each sex at different ages: the period of 20-30 records the death of females at 1,040 against 1,000 male deaths.

CHAPTER VII.—CIVIL CONDITION.

STATISTICS relating to the civil condition are to be found in Imperial Table VII. Further analysis of these figures is made in the three subsidiary tables appended to this chapter. Reference to statistics

2. The enumerators were instructed to record without question the answers given by the parties concerned as to whether they were married, unmarried or widowed. Divorcees were told to be treated as widowed. The word "marriage" as applied to Coorg signifies a contract between two parties to fulfil his or her part in life, as the main classes follow post-puberty marriage. With regard to Brahmans and a few minor communities including a section of Musalmans, the term signifies a contract between two children to live as husband and wife when they attain majority and if one of the party dies even before consummation of the marriage the surviving party is classed as widowed. The tendency during the decade has, however, clearly been towards raising the marriageable age among those who are accustomed to perform pre-puberty and also among those who perform post-puberty marriages. Definition of married

3. The total population of 163,838 persons is classified into 83,944 unmarried, 62,739 married and 17,155 widowed persons. The marginal figures show the variation among the unmarried, married and widowed as distributed per mille of males and females of all ages and religions during the past five censuses. The proportion of unmarried, married and widowed females per 1,000 males of similar condition stands at 670, 815 and 2,699 against 635, 773 and 2,990 in 1911. Variation 1881-1921

Census year.	Males.			Females.		
	Unmarried.	Married.	Widowed.	Unmarried.	Married.	Widowed
1921	...	562	386	52	453	379
1911	...	554	400	46	440	387
1901	...	555	396	49	446	378
1891	...	531	430	39	423	410
1881	...	539	410	51	398	410

4. Taking the civil condition by age periods it will be seen from the marginal statement that the married among females of the 10-15 period per 1,000 females has gone down considerably among the main religions. Similar striking improvement is deducible from the figures for the 15-20 and 20-25 age periods. The number widowed per 1,000 males is less by 6 than the 1911 figures and among females it is five more. Civil condition by age-periods

	1921	1911.	1901	1891.
All religions	41	61	69	112
Hindus	36	58	65	110
Musalmans	103	144	130	163
Christians	...	18	8	...

5. With regard to child marriage we find that 78 persons have been returned as married at the 0-5 age period against 22 in 1911. The first impression upon one's mind is that the evil has increased in the present decade. The fact, however, is that at no previous census has an attempt been made to explain the existence of child marriages in a province which is noted for its tendency towards adult marriage. Nor are the main castes in the country responsible for this peculiarity. There is a community known as Kumbaras (potters). This is a poor community mainly finding its livelihood by selling earthen pots or by hiring itself as farm labourers. They find it a grievous burden to incur any special expenditure on marriages and other ceremonies, especially as they cannot perform them without the presence of their spiritual head who is known as Dasa. They have therefore hit upon the plan of celebrating marriages at the least possible cost and in conformity with caste principles. What happens is this: Whenever the Dasa visits Coorg on his peripatetic tours, which do not generally occur at stated intervals, opportunity is taken by the community to arrange for a subscription dinner in his honour when all the available children are brought together and Child marriage

coupled off according to the inclination of their parents under the spiritual sanction of the Dasa. This accounts for the figures noted above so far as can be gathered. Such marriages rarely occur among the Lingayats. It is necessary to point out here that the return of persons married in the 0-5 period among Gaudas, Kodagas, etc., in 1911 is certainly erroneous as such occurrences are reported to be absolutely unknown among these communities.

Child widows

6. The figures regarding child widows show similar disparity when compared with last census figures, the same being 13 and 3 respectively for 1921 and 1911. These figures need no explanation in the light of the remarks made in the case of child marriages. It may, however, be stated that widow marriage is permissible among these people and doubtless the widowed will be accommodated in due course.

Universality of marriage

7. A reference to Subsidiary Table 2 will show that Coorg follows the practice of the universality of marriage.

		Number of unmarried among			
		Males	Females.	Males.	Females.
		1921.		1911	
All religions	...	61	22	61	12
Hindus	...	60	20	61	11
Musalman	...	73	13	63	13
Christians	...	127	138	206	51

The marginal statement shows the proportion of unmarried males and females per 10,000 persons of each sex of the 40 and over age period. It will be observed that the unmarried among the Hindus and Musalman females form the lowest numbers. The apparent increase in the proportion of females as compared with 1911 among Hindus can be safely said to be due to imported cases of beggars, etc. The rest of the

cases are due to constitutional defects such as insanity and a number may be said to represent women of the town.

1.—Distribution by civil condition of 1,000 of each sex, religion and main age-period at each of the last five censuses.

CHAPTER VIII.—LITERACY.

THE standard fixed for literacy was the capacity to write and read a letter to and from a friend. There is reason to believe that on the whole the enumerators have understood and acted upon these instructions.

Definition of literacy

2. Imperial Table VIII describes literacy by age and religion and Imperial Table IX gives details of literacy and illiteracy by caste, tribe or race. Provincial Table II contains information regarding literacy by taluks. Subsidiary Table 1 refers to distribution of literate and illiterate population by age, sex and religion. Subsidiary Table 1 (a) gives similar details with respect to Christians by race. Subsidiary Table 2 deals with English education by age, sex and religion. Subsidiary Table 3 shows progress in education since 1891. Subsidiary Table 4 education by selected castes and Subsidiary Table 5 number of institutions and pupils according to the returns of Education Department. Table 4 is not of much use owing to the cancellation of Imperial Table XIV on account of the inaccuracy of the figures pertaining to castes dealt with therein.

Reference to statistics

3. The outstanding feature of the education statistics is that out of a

Summary of the statistics

Province.	Number literate per mille aged 5 and over.	Number literate in English per mille aged 5 and over.
Burma	314	10
Coorg	144	20
Delhi	122	38
Bengal	104	19
Madras	98	11
Bombay	83	12
Assam	63	...
Bihar and Orissa ..	51	4
Punjab	45	7
Central Provinces ..	43	5
United Provinces ..	42	4
Travancore State ...	242	13
Cochin	185	18
Baroda	147	8
Mysore	84	12

population of 163,838, 20,643 persons have been returned as literate against 17,443 in 1911. While there was a decrease in the total population by 11,138 the increase in the number of literates by 3,200 shows the good progress the province has made in this respect, the number literate in English being 2,806 against 1,882 in 1911. The marginal figures for various provinces in India illustrate the position of Coorg. If, as is reasonable, the immigrant population is deducted from the total population and only the actual resident

population is considered, the figures of literacy are greatly increased. The situation would then be that out of a total population of 142,147 excluding children aged 5 years and under, the number returned as literate is 20,643 which works out at 144 per mille. If the immigrant population of 33,937 is excluded, the literate per mille of the indigenous population works out to 189. It is of course true that the figure 20,643 includes a few literate among the immigrants. But for practical purposes the difference would be negligible. If further the jungle tribes who are not likely to become literate for many years are eliminated from the calculation, the proportion of literate per mille works out to 222.

4. Provincial Table II gives talukwar figures of literacy. A comparison of the figures with those of the last census shows that errors have crept into the tabulation of talukwar figures for 1921, e.g., the number of literate males and females under 0-15 for Mercara is given as 323 and 111 against 366 and 145 which seems to be absurd as it is ascertained that the schools were not closed for the vacation on the date of census and that there can be no reason for decrease under this head in the taluk when the enormous progress in the educational activities in the country during the decade under report is taken into consideration. Next we find the most backward taluk in Coorg, viz., Nanjarajpatna, credited with 1,056 males and 259 females literate in English as compared with 163 males and 6 females in 1911. For these reasons the figures do not admit of any useful comparison.

Literacy by taluks

Literacy by religion

	Number per 10,000 of all ages who are literate					
	1921.		1911.		1901.	
	Males.	Females.	Males.	Females.	Males.	Females.
All religions	1,895	496	1,579	279	1,277	157
Hindus	2,116	560	1,683	288	1,206	126
Musalmans	1,894	210	1,831	169	1,687	126
Christians	3,508	2,036	3,695	1,940	3,522	1,693

5. The marginal figures illustrate the progress in literacy among the main religions as compared with two previous census. Although Christians maintain their pre-eminent position since 1901 still the percentage among males is steadily going down, while it is showing an increase among females. The progress among Hindus is substantial and among females the figure is almost double the 1911 figures. Subsidiary Table 1 (a) gives details of the educational progress among Christians by race.

Literacy by age

6. A glance at Subsidiary Table 3 will show that literacy among persons aged 10 and over per 10,000 has increased nearly one and a half times since 1891 among males; the increase among females has been four times what it was in 1891. The following statement gives particulars of the varying progress visible in literacy among the school-going population and adults in the main religions during the past three decades:—

Literate in both sexes.

	10-15.						15-20.						20 and over.

Literacy in English

7. Subsidiary Table 2 gives details of the progress of English education under all religions. We find that for every 10,000 persons there are 267 males and 56 females literate in English against 169 and 31 in 1911 and 141 and 24 in 1901. If the figures are to be accepted as correct, the period 1911-1920 seems to be one of remarkable activity in the spread of the knowledge of English. The Muhammadans seem to have awakened to the necessity of imparting English education to their children.

Literacy among various castes and tribes

8. As regards the progress of education among the various backward classes referred to in Imperial Table IX, it is worth while noting the progress among the Adi-Dravidas. 222 males and 7 females are returned as literate against 109 and 4 in the last census. This is directly due to the special institutions started by Government for the benefit of the Adi-Dravidas. Among Animists we find 130 males and 11 females returned as literate against 8 males and 1 female in 1911, which, if true, would be a remarkable achievement on the part of the community, but unfortunately the inclusion of a number of Gaudas among Animists scouts the idea of such progress among the Animists. Among the higher classes, the figure for Lingayat females is almost thrice that of the previous decade. Among Gaudas the progress is very gratifying since 2,138

males and 324 females are returned against 1,080 and 58 of 1911. Taking all factors into consideration the figures show the keen desire evinced on the part of all communities to educate their children. The Government assistance rendered in this direction is embodied in Subsidiary Table 5 which gives details of educational institutions and of pupils undergoing instruction. Ever since 1901, there is apparently a well sustained progress decade by decade in the number of children under instruction. The disappearance practically of almost all the private schools (from 33 to 5) is a sure sign of the popularity and value of instruction imparted in departmental institutions.

CHAPTER IX.—LANGUAGE.

THE languages current in Coorg are described in Imperial Table X. The Subsidiary Table attached to this chapter shows the distribution of total population by language according to the linguistic survey.

Reference
to statistics

2. The languages peculiar to Coorg are Kodagu and Yerava. Both these languages show a decrease in the number of people speaking them as compared with the 1911 census, but they are slightly better than the figures for 1901. The decrease in the Yerava language is to be accounted for by the decrease among the Yerava population. As regards Kodagu, the fact that it is spoken by a number of other communities in Coorg such as Heggadēs, Gollas, Kembattis, etc., makes it difficult to say with any degree of certainty that it is due to the decrease among Kodagas, specially as the statistics for Coorgs as analysed are inaccurate owing to the inclusion of *Jama* Vakkaligas and others.

Kodagu and
Yerava
languages

3. Among the languages in the Dravidian group, we notice a decrease in the number speaking Tulu, Malayālam and Tamil which is obviously due to the decrease in the number of immigrants of this class. There is, however, a slight increase in the Hindustani and Kanarese speaking people.

Dravidian
languages

4. The figures relating to languages foreign to India show a further fall as compared with 1911. The figure relating to Portuguese shows similar disparity as in 1911 and obviously the explanation given in 1911 must equally hold good this time also.

CHAPTER X.—INFIRMITIES.

STATISTICS relating to this chapter are to be found in Imperial Tables XII and XII-A. Subsidiary Table 1 attached to this chapter describes the figures in percentages. Reference to Statistics

2. Clear instructions were issued to the enumerators in the matter of making entries with regard to the people afflicted in various ways. There is, however, some reason to believe that some misapprehension has operated in the case of the blind as shown below. Value of the results

3. The total number of people subject to the various afflictions concerned are 66 males and 70 females as compared with 103 males and 89 females in 1911. There is a very satisfactory decrease among the number of insanes and deaf-mutes. In the case of the blind, it is noticed that, while there is a decrease of 4 among the males, there has been an abnormal increase of 16 among females over last census figures. There seems to be very little doubt that a few cases of dim perception owing to old age have been inadvertently returned as blind. Among the lepers, we find five females. This is the first instance and these cases are in all probability imported cases.

1.—Number afflicted per 100,000 of the population at each of the last four censuses.

CHAPTER XI.—CASTE, TRIBE, RACE OR NATIONALITY.

IMPERIAL Table XIII gives details relating to the caste, tribe, race or nationality of the people enumerated in Coorg. Imperial Tables XVI-A and XVI-B deal with similar details with respect to Europeans and allied races. Subsidiary Table 1 treats of variations in castes, tribes and races since 1891. Reference to statistics

2. The value of the statistics collected for this chapter has been greatly impaired by the inaccuracies that have been allowed to creep in in regard to the statistics pertaining to the most important caste in Coorg, viz., Kodagas. A perusal of the last census report shows that it was decided to distinguish between *Jama* Vakkaligas of North Coorg who used to return themselves as *Jama* Kodagas from pure Kodagas. Another distinction observed was with respect to *Amma* Kodagas and *Jama* Kodagas. The figures for Brāhmans show an unnatural increase. An attempt was made to get these errors rectified by writing to the Madras Census Superintendent to cause the statistics to be re-examined. He expressed his inability to do so owing to the destruction of the records in the abstraction office and assured us that the abstraction office was not responsible for the anomalies. The extent to which the figures have become useless for purposes of comparison can be gathered from the figures quoted in the margin, relating to some of the main castes in Coorg. Value of statistics

Name of caste	1921.	1911.
Kodaga	44,476	33,886
Amma Kodaga ..	187	517
Jama Kodaga ...	265	1,825
Brāhman ...	6,187	2,520

3. Of the two most important classes in Coorg, viz., Kodagas and Yeravas, the statistics for the former being useless for comparison purposes, it remains to deal with Yeravas. Here we find a decrease of 1,330 persons as compared with 1911 which may be accepted as being due to the effect of influenza and other causes. Yeravas

4. As regards other minor castes we find from the subsidiary table attached to this chapter that Lingayats show a welcome increase of 23·3 per cent over last census figures and Indian Christians a decrease of 7·1 per cent. Mappillas record an increase of 5·1 per cent. There has been an abnormal increase among Billavas and Binépattas, which might have been brought about by fusion of certain sub-castes different from those taken into account at the time of the last census. The decrease among Ayiris and Mēdas may be taken as reflecting the reduced opportunities for carpentry and the basket industry due to the general depression in the coffee industry. Other minor castes

5. Details about Europeans and Anglo-Indians by age, sect and race are embodied in Imperial Tables XVI-A and XVI-B. Sixty-two Europeans are described as non-British subjects. The details of these 62 persons as furnished by the Census Superintendent are given in the margin. It is of course impossible to determine how far it would be correct to class these under "Europeans unspecified" as non-British subjects. It is observed that there is a great decrease in the number of Anglo-Indians as compared with figures for 1911 (47 against 138). It is quite probable that many of the unspecified Europeans belong to this fraternity. Europeans and Anglo-Indians

CHAPTER XII.—OCCUPATION.

In order to ensure as precise a distinction as possible between actual workers and dependants, clear instructions were given to the enumerators to record first the principal occupation of the person enumerated in column 9 of the schedule; he was then required to ascertain whether such person had any subsidiary occupation in which case he was instructed to note it in column 10. He was told

Occupation or means of subsistence of actual workers		Means of subsistence of dependents on actual workers.
Principal.	Subsidiary.	
9	10	11

that column 11 was intended to show persons absolutely incapable of adding a pie to the family budget and consequently entirely depending upon the persons shown in columns 9 and 10. The headings of these columns are given in the margin. Clear instructions were also issued in regard to what constituted main and subsidiary occupations

by impressing upon them the fact that the particular occupation which brought in the greatest income was the main occupation and the other subsidiary. It is however quite possible that some carelessness has been manifested here and there, but on the whole, the figures may be taken as approximately accurate. As the classification of occupations into groups and orders was done under the supervision of the Madras Census Superintendent, the Madras system, as described in Chapter XII—Part I. of the report for the Madras Presidency for 1921 has been followed in toto.

2. The particulars obtained according to the classification scheme adopted at this census are tabulated in Imperial Tables XVII to XIX, XXI and XXII. Table XVII shows the number of persons supported by each occupation, Table XVIII Subsidiary occupation of agriculturists who are actual workers and Table XIX Subsidiary occupation of non-agriculturists. Table XX was not compiled for Coorg as in Madras. Table XXI gives details regarding occupations of selected castes, tribes or races and Table XXII deals with industrial statistics. The five subsidiary tables at the end of the chapter give an important analysis of the figures in the Imperial Tables.

3. The province is mainly agricultural. We find therefore 121,100 persons out of a total population of 163,838 living by ordinary cultivation against 120,401 out of 174,976 in 1911. Next in order come the growers of special products such as coffee, tea, rubber, etc. They total 15,194 against 22,292 in 1911. There has been an appreciable increase in the number of persons engaged in Forestry as compared with the figures for 1911 (2,127 against 1,108). This is due to the

Non cultivating land-owners					
		Year.	Males.	Females.	Depend-ants.

			+ 614	-1,801	+ 6,825

re-organization of the Forest Department carried out during the decade and to the starting of a saw mill and tramway works under departmental management. A great decrease is recorded in the figures relating to rent receivers (1,027 against 3,709 in 1911). This may be due to the reversion of many of the original non-cultivating land owners to their hereditary calling after the set back in the coffee industry. This seems to be apparent from a rise in the number of cultivating land owners noticeable in the 1921 figures.—Vide statements in the margin. The difference in the female actual workers must be due to their

The information collected

Summary of statistics

inadvertent inclusion among dependants. This seems to be the case because we find that while there is a decrease of 2,738 persons among farm servants and field labourers from the last census figures, there is an excess in the wet area of 2,368 acres which must necessarily require additional labour. The conclusion therefore seems to be clear that many workers have been classed as dependents.

**Subsidiary
occupation of
Agriculturists**

4. The number of agriculturists who have returned subsidiary occupations is considerably less than in 1911. It is however satisfactory to note an increase in the number of carpenters and traders among cultivating land owners, the figures being 90 and 262 against 33 and 133 in 1911.

**Special
products**

5. The main industry in Coorg is coffee. It will be noticed that the number of establishments on a considerable scale returned this Census is 198 against 94 of the last census. It is true that only estates employing 20 persons or more were taken into account at the time of the last census. But even making necessary allowance for this by deducting 50 establishments returned this time as employing below 20 persons each, the fact remains that there are still 148 establishments as compared with 94 of last census. It has been elsewhere noticed that the tendency on the part of the people in this decade is to abandon coffee cultivation owing to the disaster it inflicted on small capitalists. Statistics also show a decided decrease in the area under coffee. It is therefore clear that a mistake has been committed in classifying the estates employing 20 or more persons either in this or in the last census. Five rubber estates, one tea and one fibre garden have been brought to account during the decade. Rubber has been subject to many vicissitudes and large extents of ceara have been abandoned. Tea is in an experimental stage but promises well and agave fibre gives distinct hope of success. The other three industries mentioned are (1) Saw mill, (2) Sandalwood works and (3) Tramway works—all worked by Government. These do not call for any special comment.

6. Subsidiary Table 5 shows that the number of persons employed on the estates growing special products is 13,916 against 10,812, the excess being due to the greater number of coffee, rubber and other estates brought to account. The decrease in the total number of actual workers and dependants as compared with 1911 (14,398 against 22,062) is of course due to the lesser number of immigrant labour accounted for owing to slump in coffee and other cases mentioned elsewhere.

**Management
and distribu-
tion of labour**

7. Subsidiary Table 4 gives details regarding the general distribution of persons employed. The total number of Europeans and Anglo-Indians employed on estates is 103 males and 4 females as compared with 47 males in 1911. In the case of Indians the figures are 373 males and 3 females against 138 males and 3 females. There are 43 skilled workmen against 363 returned in the last census. It is to be presumed that the difference is due to an error in the classification of this class of men either at this or at the last census. The number of women employed on these establishments is in the ratio of 404 per 1,000 adult men against 490 in 1911. The proportion of children per 1,000 adults (of both sexes) stands at 94 against 109 in 1911.

Ownership

8. Part III of Imperial Table XXII deals with the ownership of the factories concerned. Those owned by companies with European Directors are 27 against 47 in 1911. Those owned by individual Europeans or Anglo-Indians are 54 against 36. Hindus own 112, Musalmans 11 and Parsis 1.

**Skilled
workmen**

9. Part IV of the Imperial Table XXII gives particulars of skilled workmen. Of the 60 persons, only 6 were born in the country.

**Unskilled
workmen**

10. Part V of the table gives a classification of unskilled labourers according to caste or race and birth-place. Of 14,315 persons only 3,412 were returned as born in Coorg.

**Nature of
power em-
ployed**

11. Part VI gives details of power employed. Mechanical power is used in 36 factories against 25 in 1911. The oil power machines were double those used in 1911. There were seven steam power machines against one in 1911.

**Market
gardens**

12. Growers of market gardens show a substantial increase over the figures of 1911, doubtless due to the profitable nature of the industry.

13. Under Industries (Imperial Table XVII) there is to be noticed a decided decrease over the 1911 figures. The main reductions are to be found under group No. 39. The decrease among carpenters, turners, etc., may be due to the reduction in the number of the immigrant classes who used to undertake building works in the interior. The great decrease among basket makers has a direct bearing on the stagnation in the coffee industry which used to be supplied with an enormous number of baskets for planting seedlings and for other purposes. **Sub-class III—Industries**
14. Order 12 has reference to food industries. Under rice pounders there is a decrease of 476 persons as compared with last census. This seems to be due to the heavy rise in the market price of paddy which induced producers to sell wholesale to traders, throwing this class of people out of employment. The great reduction in the number of toddy-drawers, viz., 1,738 appears to be due to the closing of a great many shops during the decade and the steady influence of the temperance workers in inducing people not to lease out their trees for tapping. **Order 12—Food industries**
15. Order 13 represents industries of dress and toilet. The general decrease under groups 77 to 81 indicates the decided drift of the population towards economy and thrift. **Order 13—Industries of dress and toilet**
16. In this section there is a noticeable decrease in the number of persons engaged on roads and bridges and on mechanically driven and other vehicles. This is obviously due to the reduced expenditure on Public Works since the outbreak of the war. **Sub-class IV—Transport**
17. There is a decrease of 413 persons under this heading which may be due to the elimination of petty traders consequent on the rise of prices of commodities. No comparison of the various items is possible owing to a difference in the method followed in grouping certain items from that followed in 1911. **Sub-class V—Trade in food stuffs**
18. Group 161 records an increase of 218 persons over last census figures. There has been an inexplicable decrease under group 164. The figure is certainly misleading in view of the fact that there are 377 villages with 365 patels in charge. **Public administration**
19. There is a decrease under group 167, and an increase under group 168. The former is due to the practical disappearance of the activities of the Basel Mission Church and the latter is due to faulty enumeration or classification. The lawyer element has considerably decreased. Medicine more than maintains its previous ground. There is substantial increase among women teachers. **Sub-class VIII—Profession and liberal arts**
20. The decrease in the number of the inmates of jails is due to the rule requiring persons sentenced to over six months' imprisonment to be sent to Cannanore, consequent on the reduction of the status of the Mercara Jail to that of a sub-jail. The notable decrease among beggars, vagrants, etc., is satisfactory. **Sub-class XII—Unproductive**
21. Subsidiary Table 3 gives details of statistics of main occupations (a) by orders and (b) by groups as worked per ratio of 10,000 and also the variations between 1921 and 1911. Subsidiary Table 2 gives details of postal employees. **Main occupation by orders and groups**
22. Imperial Table XXI refers to occupations of selected castes, tribes, etc. This statement cannot be usefully commented upon on account of the inaccuracy of the figures relating to the chief castes in Coorg. **Occupation of selected castes**

Table XXI.

OCCUPATIONS OF SELECTED CASTES, TRIBES, OR RACES

Note.—From this table are excluded the figures of each occupation which supports less than 250 actual workers and also against each caste the figures of occupations which are followed by very few persons. Hence the sum of the figures in columns 5 to 16 does not always agree with the total of actual workers shown in columns 2 and 3

Note.—From this table are excluded the figures of each occupation which supports less than 250 actual workers and also against each caste the figures of occupations which are followed by very few persons. Hence the sum of the figures in columns 5 to 16 does not always agree with the total of actual workers shown in columns 2 and 3.
